

# ABSTRACT

A coating film 9 is formed on a light guide-mounting portion of a frame 2.  
5 This coating film 9 presents a color reflecting light over a wide range of wavelength  
such as a white color. Instead of forming the coating film 9, a light guide 3 can also  
be mounted through a thin paper-shaped member such as a white-colored paper or a  
silver-colored paper that allows light to reflect. The coating film or the thin  
10 paper-shaped member can be provided not only on the bottom surface of the light  
guide-mounting portion of the frame 2, but also on the side thereof.
